Introduction
Although the authors correctly included important papers in this setting, we believe a couple of studies should be cited within the introduction (PMID: 33571059; PMID: 32606139; PMID: 33307876), only for a matter of consistency. We think it might be useful to introduce the topic of this interesting study.

Discussion
Very interesting and timely discussion. Of note, the authors should expand the Discussion section, including a more personal perspective to reflect on. For example, they could answer the following questions - in order to facilitate the understanding of this complex topic to readers: what potential does this study hold? What are the knowledge gaps and how do researchers tackle them? How do you see this area unfolding in the next 5 years? We think it would be extremely interesting for the readers.

However, we think the authors should be acknowledged for their work. In fact, they correctly addressed an important and timely topic, the methods sound good and their discussion is well balanced.
